# UI Screenshots and Simple Function Notes

## 2D Material Intelligent Detection Platform

The interface is shown in Chinese on purpose. Our project is prepared for a domestic Chinese university student entrepreneurship competition, so the judges, teachers, and main users are expected to read Chinese. Using Chinese makes the product demo easier to understand during the competition.

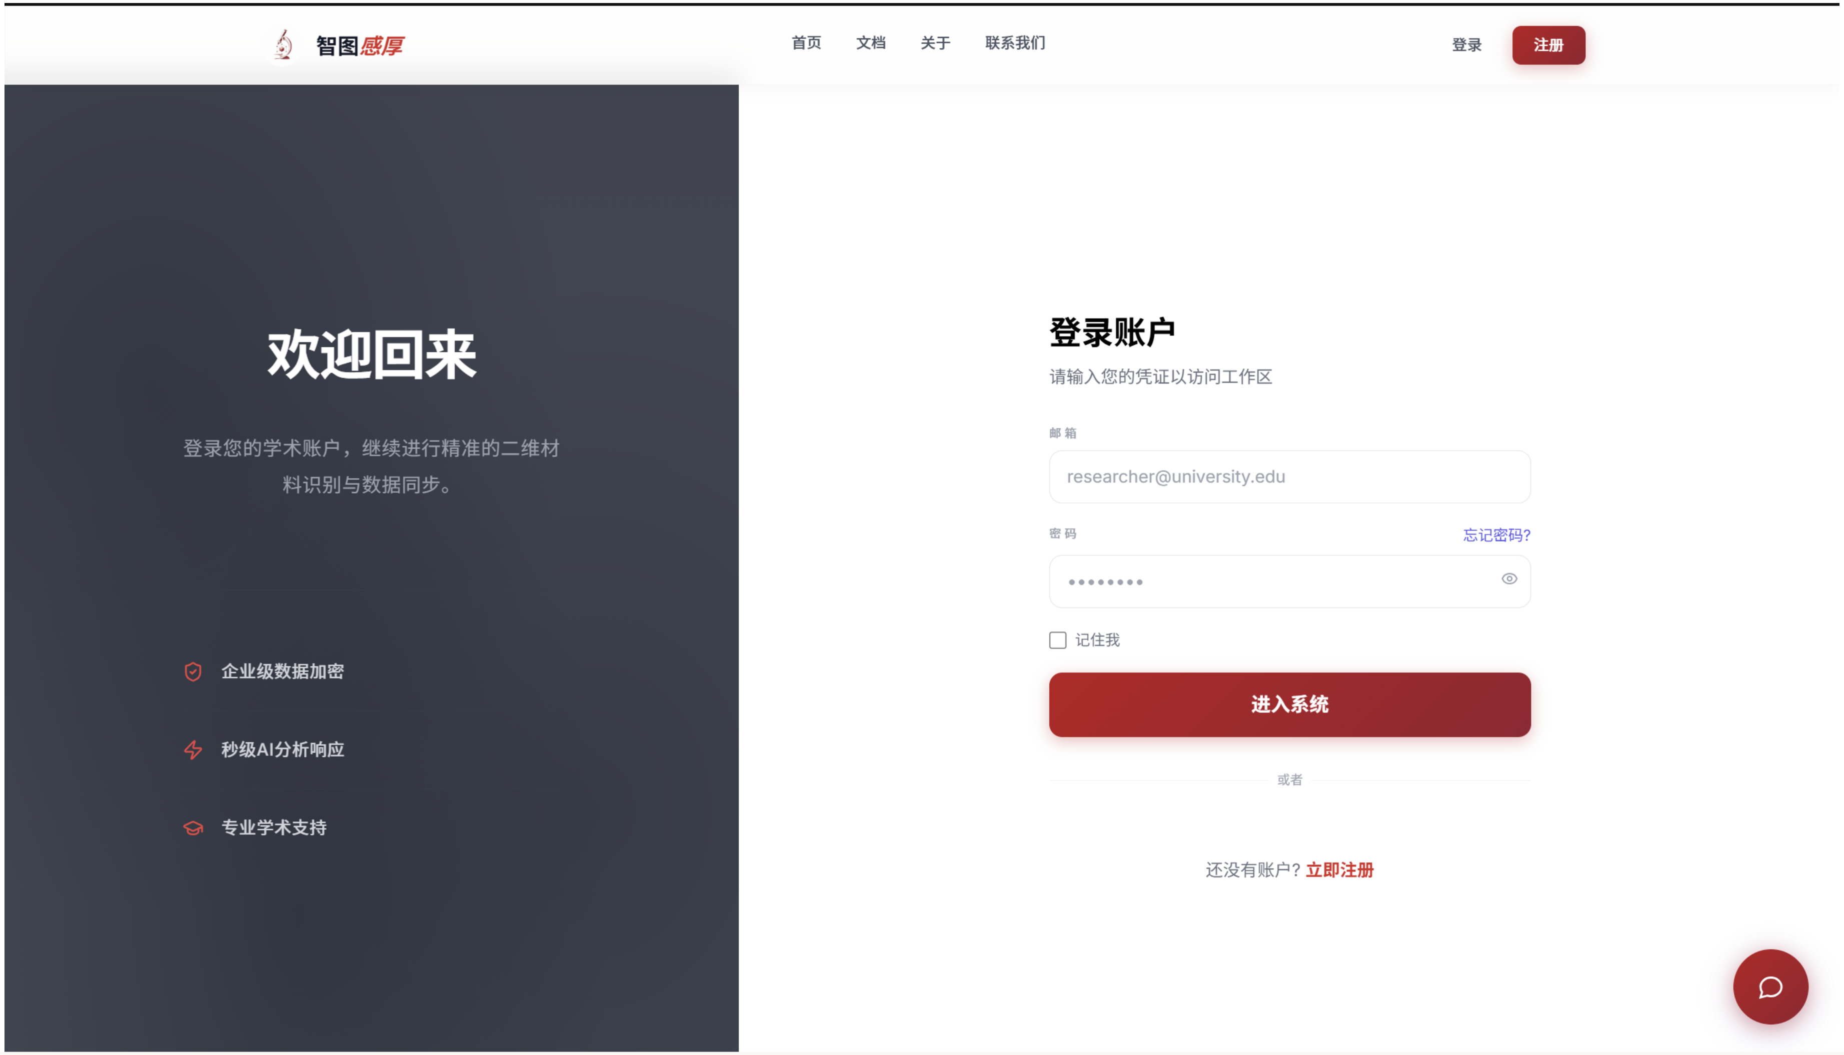
### What this PDF includes

- Actual screenshots of the web interface.
- A short and simple explanation for each page function.
- No backend code is included in this PDF; it is mainly visual evidence of our UI design.

# Homepage / Landing Page

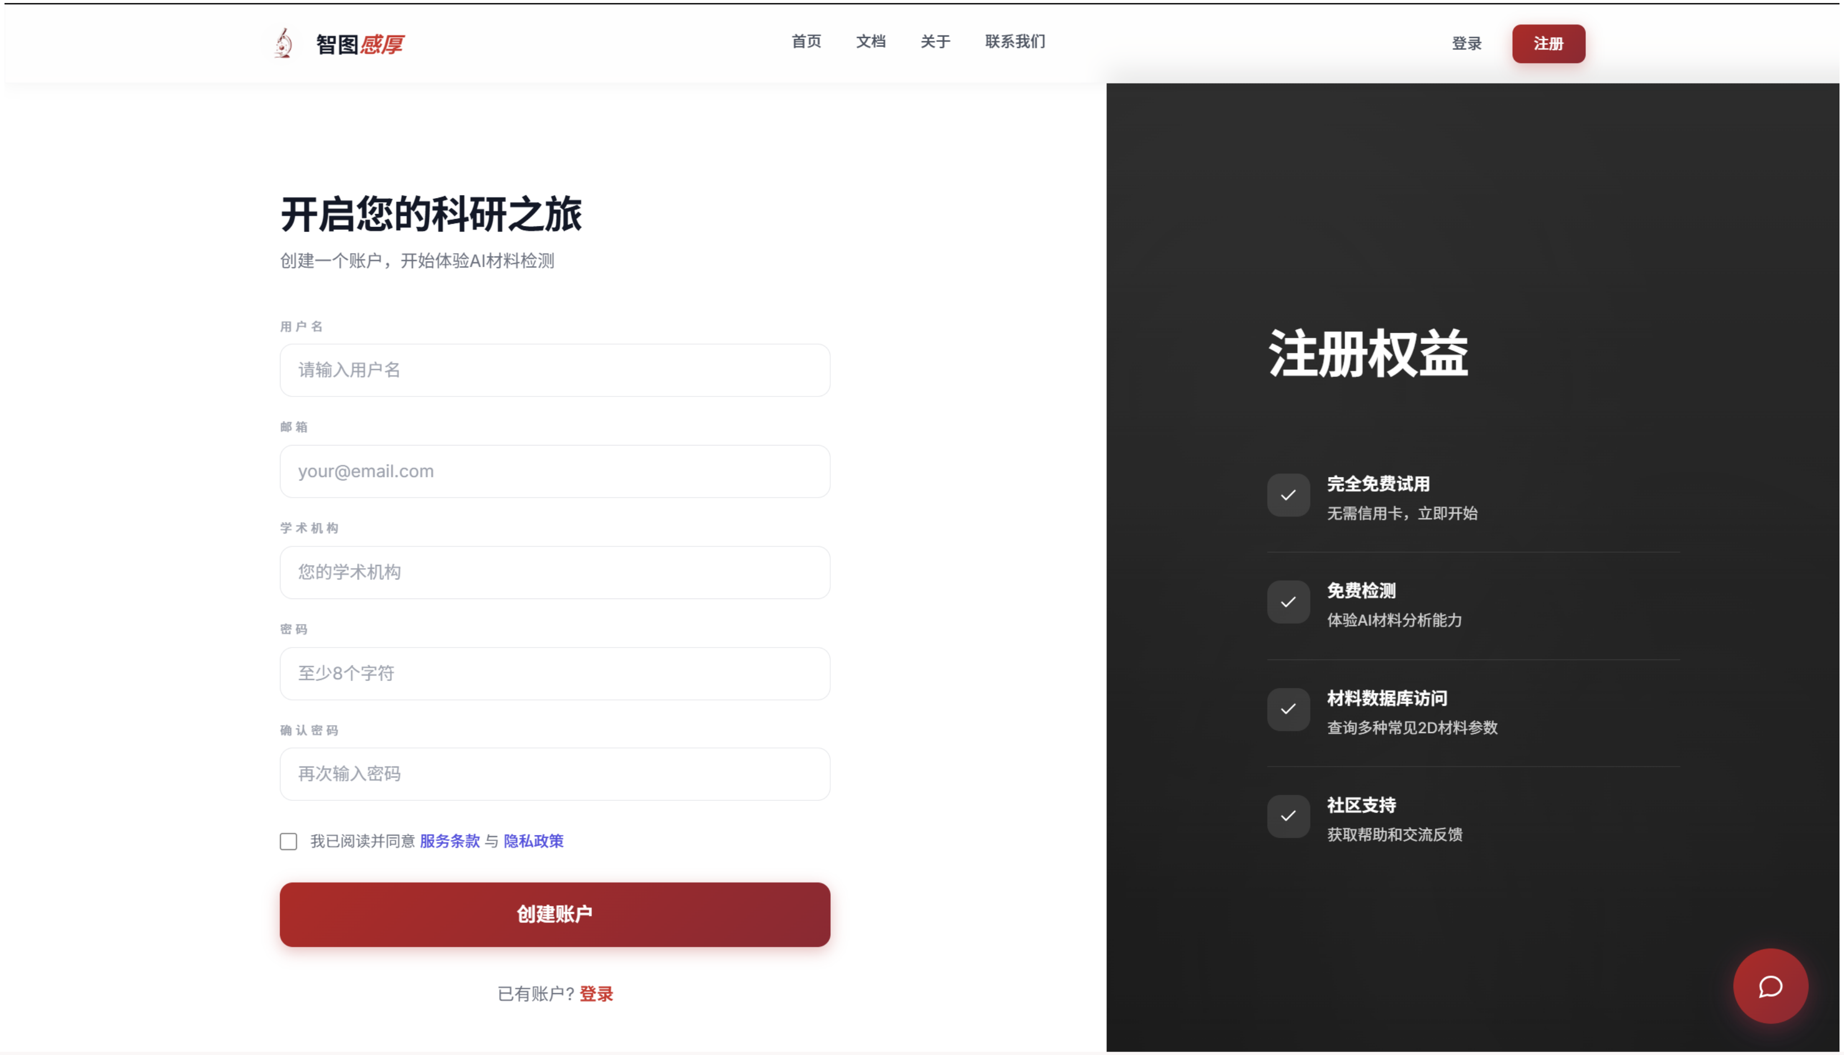
This page introduces our 2D material detection platform. It shows the project topic and gives users two clear choices: start using the system or read the documents.

# Login Page



This page lets a registered user enter the workspace. It is prepared for account-based access, so research data and model settings can be managed more safely.

# Registration Page



This page lets a new user create an account with a username, email, institution, and password. The right side lists simple benefits such as free testing, database access, and community support.

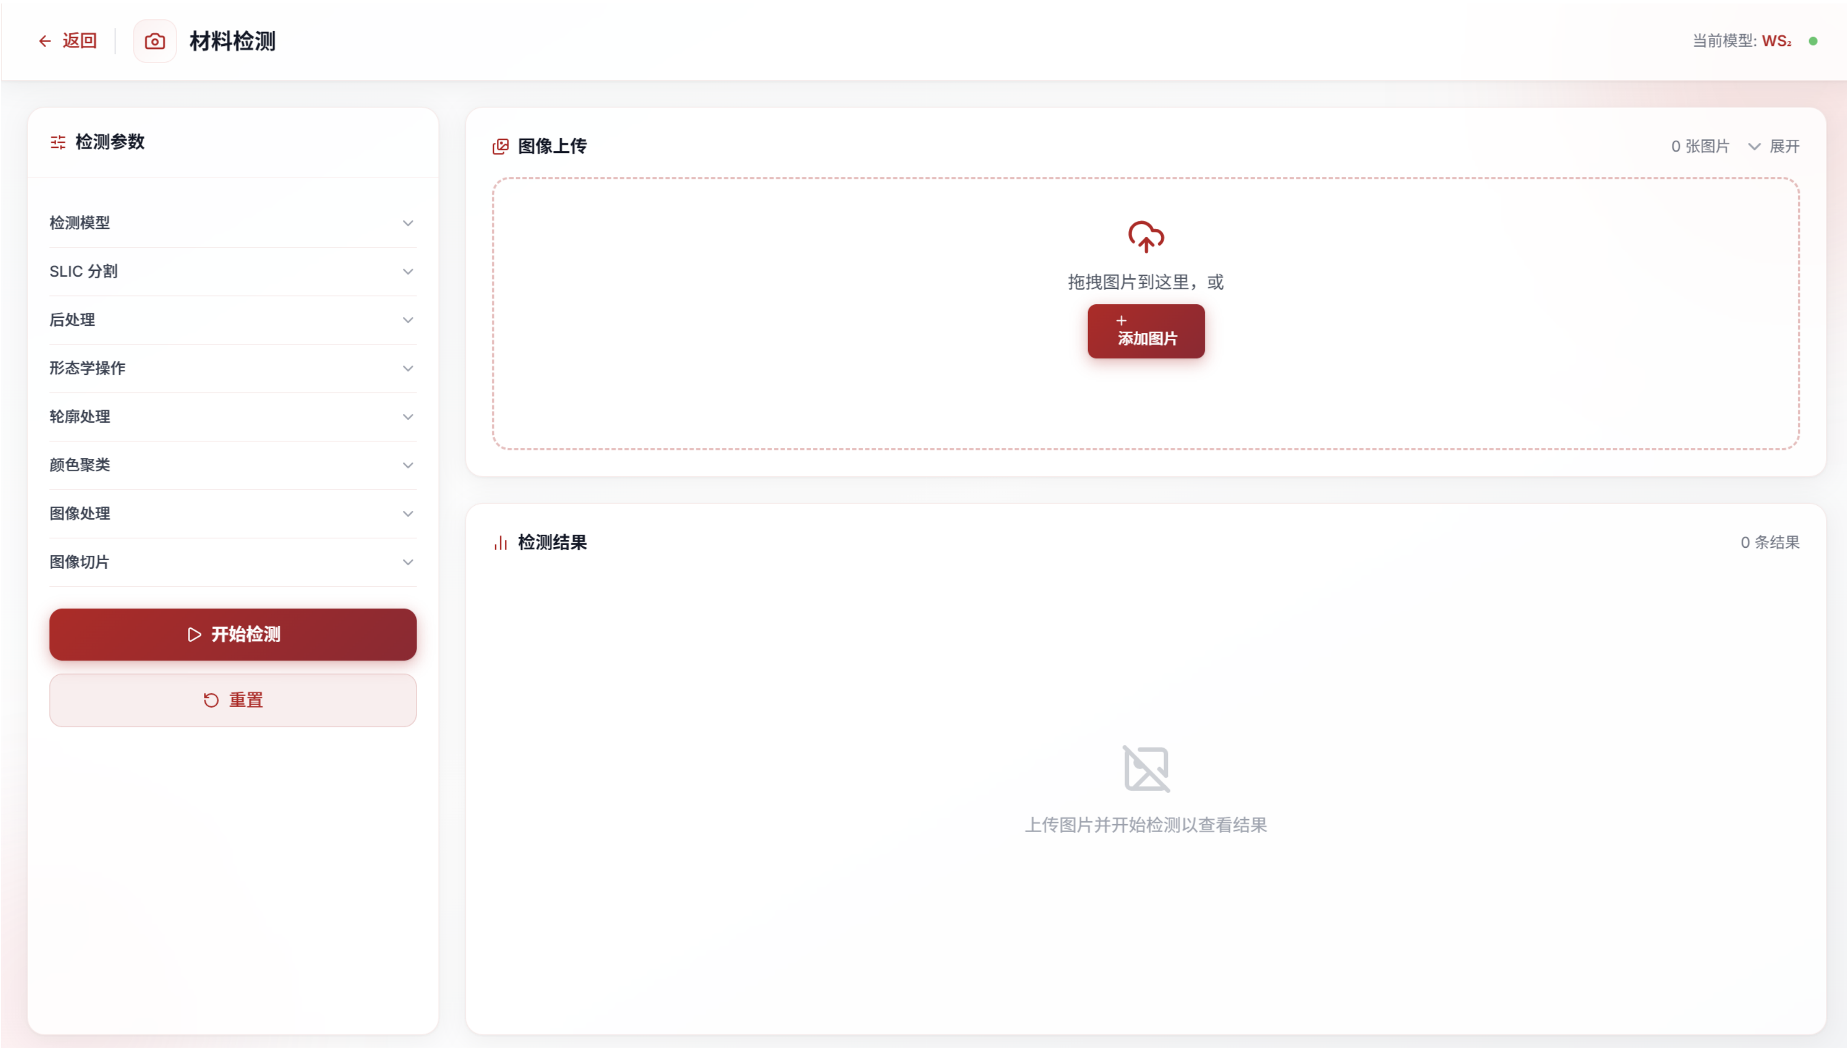
# Material Model Selection Page

This page lets the user choose a material detection model, such as WS2, MoS2, or graphene. It also shows a version number, accuracy, and update date for each model.

# Material Database Page

This page is a reference database for common 2D materials. Users can search or filter materials and read basic information such as properties, layer ranges, and expected detection accuracy.

# Material Detection Workspace



This is the main working page. Users choose a model, upload microscope images, adjust the detection settings, start detection, and check the results in the lower result area.

# Detailed Parameter Panel

This panel shows more detailed image-processing settings, including SLIC segmentation, post-processing, morphology, contour processing, color clustering, and image processing parameters.
